Research Interests

I am a plant systems biologist developing predictive regulatory-genomics approaches to identify causal mechanisms governing crop responses to pathogens and environmental stress. I integrate transcriptomics, single-nucleus multiome profiling, transcription factor–DNA binding maps, functional genetics, and interpretable network modeling to resolve cell-type-specific regulatory programs and generate experimentally testable predictions. Working across *Arabidopsis*, maize, *Brachypodium*, and sorghum, my long-term goal is to identify regulatory mechanisms, natural alleles, and engineering targets that improve durable disease resistance, stress resilience, and sustainable crop productivity.
